

# 01 Which is the Lightest Animal?

## Question

There are four kinds of stuffed animals—a pig, a cat, a rabbit, and a bear.  
They are placed on balance scales as shown below.  
Which one is the lightest of the four?

1 Pig

2 Cat

3 Rabbit

4 Bear

## Answer

The answer is **2** Cat.

 Go to the explanation! →

# 01 Explanation

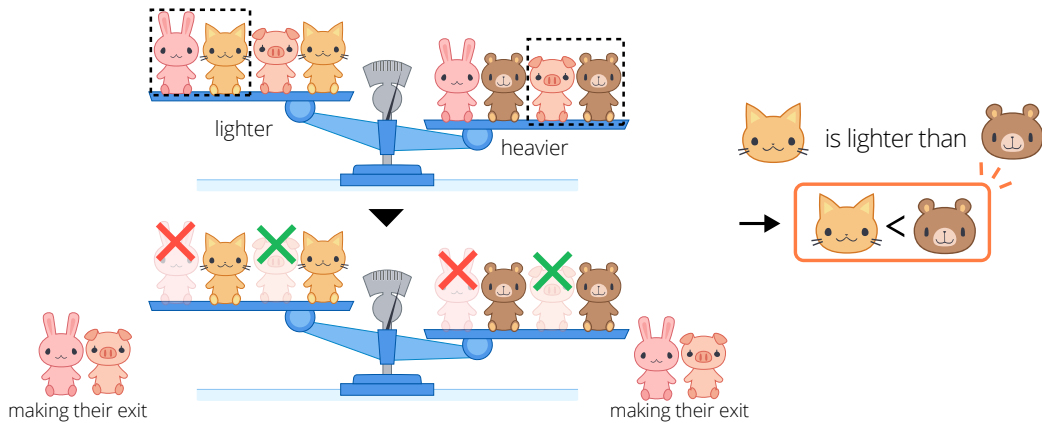

**Point** Put animals of the same weight on both sides of the scale.

Step ① Compare [a] with [b].

b-1 Remove the animals which are on both sides of the scale.

 **Move on!** →

# 01 Explanation

**a**

(balanced)  
same weight

Next, put these animals on the other side of scale [b].

**b-2**

lighter

heavier

is lighter than

$\text{pig} < \text{rabbit}$

Step ② Compare [a] with [c].

**a**

same weight

Put them on scale [c] and compare!

**c-1**

heavier

lighter

is lighter than

$\text{bear} < \text{rabbit}$

**Move on!** →

# 01 Explanation

## Result Which is the lightest?

As in steps ① and ②, the relation between the animals in weight is as follows...

Step①

Step②

Therefore, the answer is: 2 The cat is the lightest.

## 02 4-Digit Password

### Question

Joey had totally forgotten the password for his cell phone.  
He tried to remember the number.

Joey's

1st try

Was it **6 0 8 7** ?

2nd try

No? Well, then... **5 1 7 3** ?

3rd try

Seriously? OK, try **1 3 5 8** !!

4th try

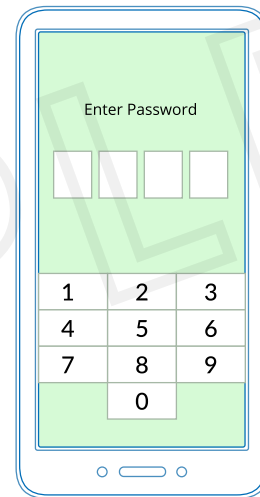

Wait! How about... **3 8 2 5** ?

5th try

This can't be true...  
Ah, yes! Must be **2 5 3 1** !!

After missing out all five tries, he finally nailed it at the sixth shot. He found out that every guess he made included two correct digits, although they were not put in the correct places.

What is the four digit code needed to unlock the phone?

### Answer

The answer is **8712**.

Go to the explanation! →

# 02 Explanation

Step ① What numbers are **not** used for the password?

### Question

After missing out on all five tries, he finally nailed it at the sixth shot. He found out that every guess he made included two correct digits, although they were not put in the correct places.

Read the question carefully and let's put it in a simpler way.

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |
|                | ↓ | ↓ | ↓ | ↓ |
|                | ? | ? | ? | ? |

|              |              |              |              |
|--------------|--------------|--------------|--------------|
| 0            | <del>0</del> | 0            | 0            |
| <del>1</del> | <del>1</del> | 1            | <del>1</del> |
| <del>2</del> | 2            | <del>2</del> | 2            |
| <del>3</del> | <del>3</del> | <del>3</del> | <del>3</del> |
| 4            | 4            | 4            | 4            |
| <del>5</del> | <del>5</del> | <del>5</del> | <del>5</del> |
| <del>6</del> | 6            | 6            | 6            |
| 7            | 7            | <del>7</del> | <del>7</del> |
| 8            | <del>8</del> | <del>8</del> | <del>8</del> |
| 9            | 9            | 9            | 9            |

### Point

All the numbers Joey used were put in the wrong places - so we can't use numbers in their original position.

Not used in any place!

## 02 Explanation

Step ② What numbers **are** used for the password?

According to Step ①, let's exclude 3 & 5. They aren't used at all.

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |

Since "every guess he made included two correct digits",

**Point**

1, 2, 7, 8 are definitely in!

Step ③ Arrange the four digits to discover the password.

Now it's time to decide the order of 1, 2, 7, 8.

Remember that each digit cannot be put in the place that Joey originally tried.  
Let's look at each digit one by one.

I. Where does 1 go?

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |

→

|  |  |   |  |
|--|--|---|--|
|  |  | 1 |  |
|--|--|---|--|

Only fits here!

 **Move on!** →

# 02 Explanation

II. Where does 2 go?

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |

→

|  |   |  |   |
|--|---|--|---|
|  | 2 |  | 2 |
|--|---|--|---|

Either of these.

III. Where does 7 go?

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |

→

|   |   |  |  |
|---|---|--|--|
| 7 | 7 |  |  |
|---|---|--|--|

Either of these.

IV. Where does 8 go?

|                |   |   |   |   |
|----------------|---|---|---|---|
| Joey's 1st try | 6 | 0 | 8 | 7 |
| 2nd try        | 5 | 1 | 7 | 3 |
| 3rd try        | 1 | 3 | 5 | 8 |
| 4th try        | 3 | 8 | 2 | 5 |
| 5th try        | 2 | 5 | 3 | 1 |

→

|   |  |  |  |
|---|--|--|--|
| 8 |  |  |  |
|---|--|--|--|

Only fits here!

 **Move on!** →

## 02 Explanation

Now, you can work out the position for 7.

Fixed digits 

Which place is for 7? 

  
HERE!

Finally, you can work out the position for 2!

Fixed digits 

Where does 2 go? 

  
HERE!

### Result

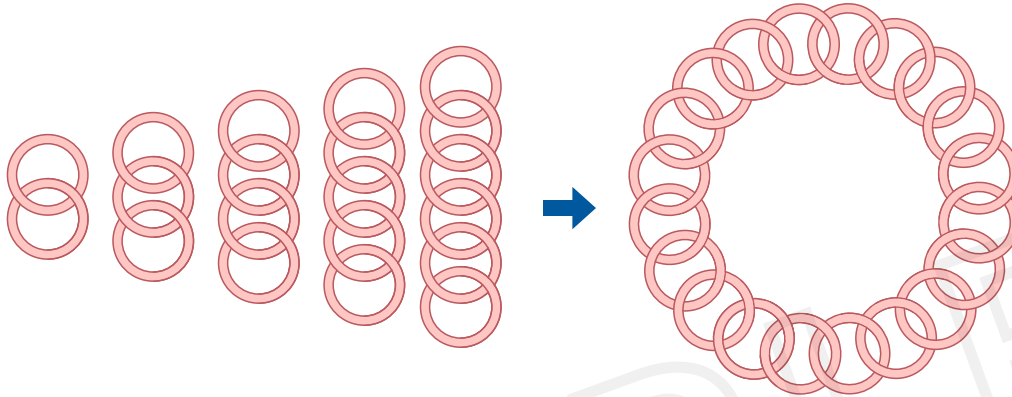

According to Steps ①, ② & ③,

the four digit password is 

## 03 Five Sets of Rings

### Question

We assemble five sets of jump rings into a linked circle as shown below.

The rules to assemble rings are as follows:

It costs \$1 to cut open a ring.

It costs \$2 to weld a ring closed.

What is the lowest fee to make it?

### Answer

The answer is \$12.

 [Go to the explanation! →](#)

# 03 Explanation

Step ① Cut open one ring from each set and join it to the next set!

Let's give them 5 different colors!  
It looks much clearer.

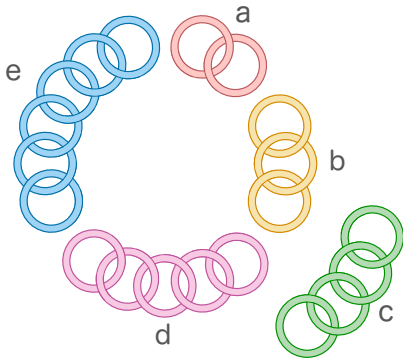

Since it costs \$1 to cut open  and \$2 to weld  a ring...

A pair of one "open" & one "weld" costs \$3.  **$\$3 \times 5 \text{ pairs} = \$15$**

 **Move on!** →

# 03 Explanation

Step ② Can we make fewer than five pairs?

**Point**

What if there were fewer joints?

Reduce the number of joint rings!

Choose "Ring Set [c] and cut all the rings open!

Then use those rings as joints between the rest of ring sets [a, b, d & e].

Now, we only need 4 pairs of "open" & "weld"!  
 meaning...the lowest cost possible is  **$\$3 \times 4 \text{ pairs} = \$12$**

Therefore, the answer is "12".

## 04 Juice Bottles

### Question

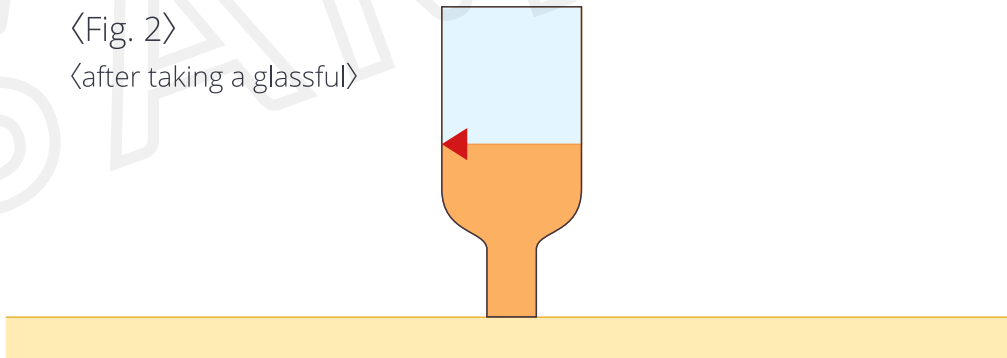

Juice fills the bottle up to the red arrow, 9 cm from the bottom.

When you turn the bottle upside down, the juice comes to 3 cm above the arrow as Fig 1.

Next, you take a glassful of juice from the bottle and then turn the bottle upside down. In this case, it fills up to the red arrow as Fig 2.

<Fig. 2>  
<after taking a glassful>

How many glasses of juice does this bottle hold?

### Answer

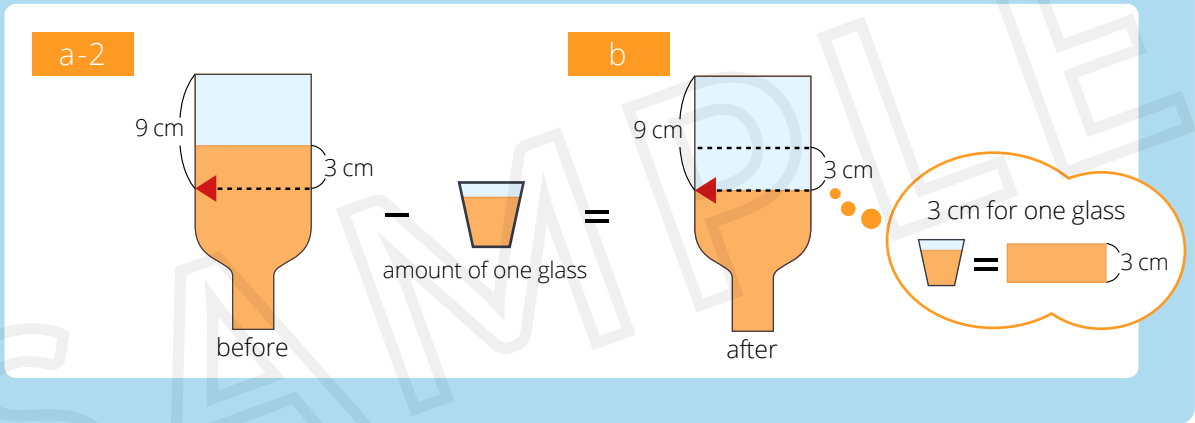

The answer is 5 glasses.

 [Go to the explanation!](#) →

# 04 Explanation

Step ① How much is in a glass of juice?

Step ② How much juice/space was there in the bottle to start?

**Move on!** →

# 04 Explanation

## Result

As in step ②, when you pour juice in the bottle [a-2] to fill it up...

Therefore, the answer is: 5 glasses

## 05 Apples & Oranges

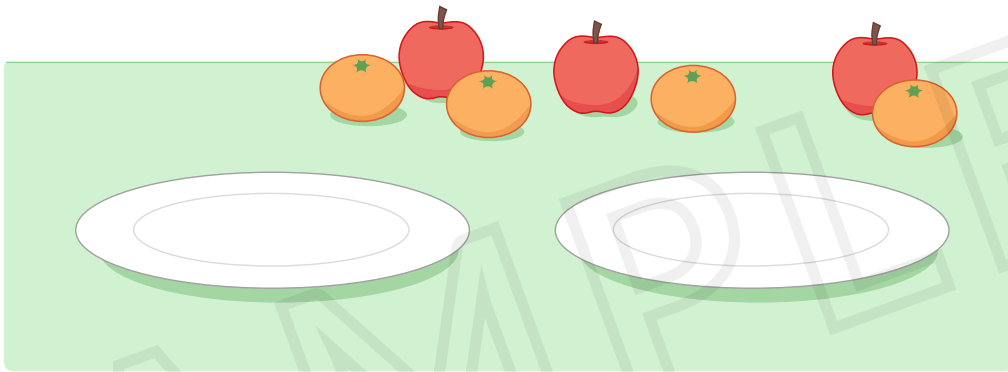

### Question

We have 18 apples and oranges altogether, and there are more oranges than apples.

Now we divide them into two groups of nine and put them on plates.

Both plates have at least one apple and one orange.

When one plate has seven apples on it, how many oranges do we have in total?

1 8

2 9

3 10

4 11

5 12

### Answer

The answer is **3** 10.

 Go to the explanation! →

# 05 Explanation

Read the question carefully, and solve the problem step by step.

**Question**

We have 18 apples and oranges altogether, and there are more oranges than apples.

Let's stop here for now.

Now we divide them into two groups of nine and put them on plates.  
Both plates have at least one apple and one orange.  
When one plate has seven apples on it, how many oranges do we have in total?

Line all the apples and oranges up in a row.

Step ①

18

There are more oranges... → There are fewer apples...  
→ There are apples up to 8 !!

**Move on!** →

# 05 Explanation

## Question

We have 18 apples and oranges altogether, and there are more oranges than apples.

Now we divide them into **two groups of nine** and put them on plates.

Both plates have at least **one apple and one orange**.

When **one plate has seven apples** on it, how many oranges do we have in total?

## Step 2

There are **7** apples out of **9**.  
 → There are **2** oranges.

There is at least one apple and one orange.

There are already 8 apples in total.

## Result

So, there are **8** apples, and the rest are all oranges!

Therefore, the answer is " **1** **10**".
